Screening for anti-viral agents - by detecting the ability of agent to disrupt the interaction of a Bak protein and a viral protein

an

Disclosure: Fig 1; 24pp; English.

The sequence encodes Bak protein, which is a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1 protein, and is capable of modulating apoptosis. The Bak gene is located on human chromosome-6 at 6p21-23. The protein may be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak protein and a viral protein (e.g. EBV BHRF1), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak and viral proteins allows viral replication or

Claim 4; Fig.3A-C; 66pp; English.
Claim 4; Fig.3A-C; 66pp; English.
Cdn-1 cDNA was isolated from a human heart cDNA library using a previously isolated clone as probe. Recombinant Cdn-1 was produced in 5f9 and human colon adenocarcinoma HT29 cells. Expression of Cdn-1 in MI-LZ lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis.

Claim 6; Fig.5A-H; 66pp; English.
Claim 6. Fig.5A-H; 66pp; English.
Cdn-2 cDNA was isolated from a human placental genomic library using a 950 bp fragment of Cdn-1 cDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

p prods. for cell proliferation
                                                                                                                                              Claim 5; Fig 4; 100pp; English.

A full-length cDNA clone (T17375) codes for Bcl-Y (R81451), a profein that induces apoptosis in cells and functions as a negative regulator of Bcl-2 function. It was isolated from a Jurkat cell CDNA library using as probe a partial Bcl-Y cDNA clone obtd. by PCR of DNA derived from the Namalwa cell line. The cDNA can be use for prodn. of recombinant Bcl-Y, as a probe, to produce transgenic animal models, and in the gene therapy of disorders characterised b inappropriate cell proliferation or cell death.

                                                                                    The sequence encodes Bak. Superior, which is a bc1-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1 protein, and is capable of modulating apoptosis. The Bak-2 gene is located on human chromosome-20. The protein may be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak-2 protein and a viral protein (e.g. EBV BHRF1), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction and absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or disquostic agents. Sequence 1286 BP; 298 A; 341 C; 328 G; 319 T;

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having quanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NPRB; ANP; BNP; CNP; kidney failure; heart failure; protein kinase; hyperaldosteronism; glaucoma; guanyl cyclase. The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having gnayl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                       UI Standard; DNA; 1047 BP.

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of MK14 (051735). It hybridized to all app. of mycobacteria tested, but cross reacted to a few non-mycobacterial app. The probe may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligo:nucleotide probes specific for Mycobacteria - used for detection and amplification of Mycobacteria nucleic acid in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               31-Mar-1994 (first entry)
Oligonucleotide probe MK14-A

                                                                                                                                                                                                                                                                                                                                                                                                            E.coll beta-galactosidas rete introduce into the atput ingulation as single stranded template and an oligonucleotide was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which see also P80575.

                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure: p; English.

Random point mutations were introduced into the alpha fragment of E-coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1; Gaps

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

CONTAGE is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB) 1(TGC) 2(NNB) 4Z(NNB) 8(TGC) (NNB) CCC 19X; X and Y are flanking restriction sites (X is not the same as Y) CCC 19X; X and Y are flanking restriction sites (X is not the same as Y) CCC 19X; X and Y are flanking restriction sites (X is not the same as Y) CCC are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are concatenated by these generic sequences are shown in R65151-54. TSARs are peptide between the 2 domains. The oligonoclectides are also designed so that the expressed peptide contains 2 or 4 cysteine residues confer some degree of conformational rigidity to the peptides. The TSARs or compans. comprising a TSAR binding domain can be used in credition or peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. Complex methods of hybridomal antibodies and therefore circumvent the need for complex methods of hybridomal formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing clienter and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Tat primer=M13 - 21 library=Rat PC-12 cells, untreated vector=pBluescript SK- Rsitel=EcoRI Rsite2=XhoI poly(A)+ RNA was purified from untreated PC12 cells cultured for 9 days. cDNA was constructed using an oligo-dT primer and directionally cloned using the Lambda 2AP II Vector Kit by Stratagene.
                                                                                                                                       Marra,M., Hillier,L., Allen,M., Bowles,M., Dietrich,N., Dubuque,T., Geisel,S., Kucaba,T., Lacy,M., Le,M., Martin,J., Morris,M., Schellenberg,K., Steptoe,M., Tan,F., Underwood,K., Moore,B., Theising,B., Wylle,T., Lennon,G., Soares,B., Wilson,R. and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3/]; double-stranded CDNA was ligated to Eco El adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco El sites of the modified pT713 vector. RNA provided by Dr. Bertrand Jordan. Library went through three rounds of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo."

rat primer-M13 Reverse library=Rat PC-12 cells, untreated vector=pBluescript SK- Rsitel=EcoRI Rsite2=XhoI poly(A)+ RNA was purified from untreated PC12 cells cultured for 9 days. cDNA was constructed using an oligo-d7 primer and directionally cloned using the Lambda ZAP II Vector Kit by Stratagene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Rodentia; Sciurognathi; Myomorpha; Muridae; Murinae; Rattus.
